PROFESSIONAL SUMMARY

Software engineer with 3.5+ years of experience across web apps, desktop tools, and network infrastructure. Currently at RUDRA Cybersecurity, building the platform behind 1,300+ production routers and 370+ users. Previously cut STT costs by 40% with an in-house Whisper pipeline and drove a Play Store app from 3.9 to 4.8 stars at English Quest.

EXPERIENCE

Software Engineer

RUDRA Cybersecurity

Sep. 2024 – Present

Mumbai, India. (Hybrid)

- Across 1,300+ production routers (500+ GB/day): rewrote data usage tracking from per-WAN to per LAN-WAN pair for 3x finer-grained visibility, with WAN cutoff, queue-based upload/download throttling, and a zero-downtime rollout that migrates the last 6 months of usage data per-router on reset. Built WAN speed monitoring as a net-new capability with a two-tier ingress: routers log per-interface upload/download metrics to a local buffer, and the backend polls on a schedule to ingest, persisting 500K+ datapoints/day into PostgreSQL with date-range-tuned indexes. The React dashboard renders dual-axis area charts with date-range filtering and CSV/PNG export.
- Migrated the audit trail from Postgres to Elasticsearch to fix slow text searches that timed out at over a minute. Queries now return in under a second across 10K+ events/day. Re-modeled the schema with parent-child trail linking and structured change diffs, with role-level filtered visibility and cursor-based pagination.
- Reworked the RBAC system into a 5-level role hierarchy with per-module CRUD permissions across 40+ modules, with multi-level scope support. Used Hasura JWT custom claims to enforce row-level access control on the GraphQL frontend, now governing 370+ users and enabling onboarding of larger enterprise tenants.
- Designed static VPN IP assignment across 2 backend services, replacing a dynamic IP pool that drifted on reconnect with a PostgreSQL-backed allocation synced to the VPN server's per-client config. Concurrency-safe assignment, conflict detection with bounded retry, transactional rollback on failure, and automatic IP reuse on device re-creation.
- Ported backend services from Python Prisma to asyncpg with raw SQL. Cut entry-point import time from around 27s to under 1s by eliminating the Prisma client init that ran on every service cold start. Replaced Prisma's application-level relation loading with database-side SQL JOINS, cutting query time on relation-heavy reads.
- Shipped device lifecycle (activation, deactivation, scheduled toggles, deletion) with reversible network-layer enforcement and billing that halts from the exact deactivation timestamp, replacing a delete-only pause model. Integrated with the billing system, including billing exports.

Full Stack Developer

The English Quest

Aug. 2022 – Aug. 2024

India. (Remote)

- Replaced the external Speech-to-Text vendor with an in-house OpenAI Whisper pipeline, cutting STT costs by 40%.
- Built the messaging stack on WATI WhatsApp APIs and webhooks plus NodeMailer for email, lifting delivery efficiency 40% and saving 20 hours/month of manual work.
- Implemented User Activity History tracking in the CRM portal with timestamps and contextual metadata, used by support and product teams for debugging.
- Built responsive, modular components shared between React (web) and React Native (mobile), enabling cross-platform feature parity from a single codebase.
- Drove the Play Store app rating from 3.9 to 4.8 stars by rebuilding key React Native screens for responsiveness and UX.

TECHNICAL SKILLS

Languages: Python, TypeScript, JavaScript, SQL, Bash, HTML/CSS.

Backend & API: FastAPI, Node.js, Express.js, REST APIs, GraphQL, Async I/O, JWT, OAuth.

Frontend: React, React Native, Next.js, Apollo Client.

Databases: PostgreSQL, Redis, Elasticsearch.

Infrastructure: Docker, Linux, Hasura, MikroTik RouterOS.

Concepts: Microservices, Distributed Systems, System Design, RBAC, Time-series Ingestion, Event-driven Architecture.

EDUCATION

Bachelor of Computer Applications

Gujarat University

Jun. 2019 – Apr. 2022

Ahmedabad, India.
