PROFESSIONAL SUMMARY

Software engineer with 3.5+ years of experience across web apps, desktop tools, and network infrastructure. Currently at RUDRA Cybersecurity, building the platform behind 1,300+ production routers and 370+ users. Previously cut STT costs by 40% with an in-house Whisper pipeline and drove a Play Store app from 3.9 to 4.8 stars at English Quest.

EXPERIENCE

Software Engineer

RUDRA Cybersecurity

Sep. 2024 – Present

Mumbai, India. (Hybrid)

- Rewrote data usage tracking across 1,300+ production routers (500+ GB/day) from per-WAN to per LAN-WAN pair for 3x finer-grained visibility. Added IP-route-distance-based WAN cutoff, queue-based upload/download throttling, and a version-gated rollout that migrates the last 6 months of usage data per-router on reset, with zero fleet-wide downtime.
- Migrated the audit trail from Postgres to Elasticsearch. The prior free-text description column timed out on ILIKE searches (1+ min); queries now return in under a second across 10K+ events/day. Re-modeled parent-child trail linking and structured change diffs (router/fleet/tenant context) for the Elastic schema, with role-level filtered visibility and cursor-based pagination.
- Reworked the RBAC system into a 5-level role hierarchy with per-module CRUD permissions across 40+ modules. Users can be scoped to specific tenants, fleets, or routers. Used Hasura JWT custom claims to enforce row-level access control on the GraphQL frontend, now governing 370+ users and enabling onboarding of larger enterprise tenants.
- Designed static VPN IP assignment across 2 backend services, replacing OpenVPN's dynamic pool (where IPs drifted on reconnect and broke DB references on pool-state loss) with a PostgreSQL pool written to OpenVPN CCD files. Concurrency-safe allocation, conflict detection with bounded retry, transactional rollback on failure, and automatic IP reuse when a device is re-created with the same serial number.
- Ported backend services from Python Prisma to asyncpg with raw SQL. Cut entry-point import time from around 27s to under 1s by eliminating the Prisma client init that ran on every service cold start. Replaced Prisma's application-level relation loading with database-side SQL JOINS, cutting query time on relation-heavy reads.
- Built WAN speed monitoring as a net-new capability: RouterOS scripts log per-interface upload/download metrics to an on-router file every 2 minutes, while the backend SSH-polls each router every 15 minutes to ingest, persisting 500K+ datapoints/day into PostgreSQL with indexes tuned for date-range queries. The React dashboard renders dual-axis area charts with date-range filtering and CSV/PNG export.
- Shipped device lifecycle (activation, deactivation, scheduled toggles, deletion) with reversible network-layer enforcement that disables router interfaces, blocks the OpenVPN IP, and halts billing from the exact deactivation timestamp, replacing a delete-only pause model. Integrated with the billing system, including billing exports.
- Maintained and extended the router provisioning desktop app used to flash every production router. Added white-label theming (3 brands), branding package install, captive portal setup, VPN certificate deployment, and connectivity checks with retry. Migrated the whole utility from PySide6/QML to Electron.

Full Stack Developer

The English Quest

Aug. 2022 – Aug. 2024

India. (Remote)

- Replaced the external Speech-to-Text vendor with an in-house OpenAI Whisper pipeline, cutting STT costs by 40%.
- Built the messaging stack on WATI WhatsApp APIs and webhooks plus NodeMailer for email, lifting delivery efficiency 40% and saving 20 hours/month of manual work.
- Drove the Play Store app rating from 3.9 to 4.8 stars by rebuilding key React Native screens for responsiveness and UX.

TECHNICAL SKILLS

Languages: Python, TypeScript, JavaScript, SQL, HTML/CSS.

Frameworks: FastAPI, React, React Native, NextJS, Node.js, ExpressJS.

Databases: PostgreSQL, Redis, Elasticsearch.

Infrastructure: Docker, Hasura, MikroTik RouterOS.

Tools: Git, GitHub, GraphQL, Apollo Client.

EDUCATION

Bachelor of Computer Applications

Gujarat University

Jun. 2019 – Apr. 2022

Ahmedabad, India.
